

1                                   ABSTRACT OF THE DISCLOSURE

2           A system and method for establishing communication with any  
3   one of a variety of different wireless communication devices  
4   including through the provision of a short range transceiver  
5   assembly so as to provide data communication from a sender to  
6   the wireless communication device either over the Internet,  
7   utilizing an Internet access facility, such as a computer, or  
8   alternatively using an over-the-air network, compatible with the  
9   communication device.   The wireless communication device is  
10  structured to operate on either of at least two independent  
11  frequencies for communication with the computer or with the  
12  over-the-air network, dependent on predetermined parameters  
13  including the acceptance of a unique identifier or code and/or  
14  the positioning of the wireless communication device, within a  
15  predetermined vicinity range relative to the computer.  An auto-  
16  switching capability establishes data communication with the  
17  computer or with the over-the-air network, dependent on whether  
18  the identification and vicinity parameters have been met.
